J. HUGO ARONSON
GOVERNOR

State of Montana
Office of The Governor
Helena

December 9, 1960

TO THE PEOPLE OF
THE STATE OF MONTANA:

This booklet, prepared through the joint effort of the United States Department of Agriculture and the State Department of Agriculture, headed by Mr. Albert Kruse, Commissioner of Agriculture, provides much needed agricultural statistical information, covering the past two year period, which can be used by many public and private organizations toward the development of improved agricultural practices and for the greater welfare of the people of the Treasure State.

I believe that this eighth volume of Montana Agricultural Statistics will prove of great value to all persons planning the future of agriculture, one of Montana's most vital industries.

I am sure you will join with me in congratulating those who have had a hand in the production of this publication.

Very truly yours,

J. Hugo Aronson
Governor

PREFACE

Agriculture has, for several decades, been Montana's leading industry and may be expected to have profound influence on the State's economy for many years to come. People associated with this major endeavor constantly seek yardsticks of production which are vital to their decisions and plans. This encompasses the broad groups of processors, shippers, dealers, brokers, wholesalers and retailers of farm produce. Also, a large gamut of manufacturers whose products are distributed to farmers and ranchers or used by others to serve agriculture. The scope of goods and services used by the farm operator and his family is virtually all inclusive. Agriculture has much control over all other segments of the economy and it is essential that facts be assembled to reflect current and potential output of agricultural products.

The Agricultural Estimates Division of the Agricultural Marketing Service, United States Department of Agriculture, has the responsibility of assembling and publishing agricultural data. Information on production, supply and price of agricultural commodities for Montana and the United States is issued currently in mimeographed form by the agency office in Helena, Montana. To meet the need for county and district data, not available under the Federal program, this bulletin has been prepared under a cooperative agreement with the Montana Department of Agriculture. Funds appropriated by the Montana Legislature have made it possible to supply many interested persons, inside and outside the State, with more detailed information on Montana's agriculture.

IN THIS ISSUE

Crop and livestock statistics by counties for recent years appear in this volume. With similar information for earlier years recorded in previous issues, a sixteen-year series of county data are now available for most crops and livestock items. Longer series are in print for the major grains. Items of special interest are documented herein and identified by the brief descriptions of contents below. The general layout and arrangement of the tables in this bulletin is similar to that in Volume VII.

Official crop and livestock estimates are prepared mostly from sample data reported on mail questionnaires by farmers and ranchers. Record data on marketings, shipments, processing, etc., are utilized in the estimation process and also serve as a basis for revision after the close of the marketing period. With exception of a few items for 1957, the series of State data in this issue for the years 1950 through 1957 are the same as in Volume VII. Contents of this bulletin are as follows:

Climate Data, page 5, for selected stations present a rough pattern of moisture and temperatures by counties. Climate may vary widely between these locations because of the great changes in elevations from mountain tops to valley streams.

Cash Receipts, page 6, exclude cash values of agricultural products used on farms and ranches. Receipts from marketings in 1958 reached an all-time peak due to the favorable market for cattle. The sharp increase in receipts for cattle and calves is reflected by the tables on page 7. Cattle and wheat account for the major part of Montana's agricultural income each year. Cash receipts by counties, pages 8 and 9, offer a comparison of 1958 and 1959 income and the division of income between crops, livestock and government payments. A decrease in number of farms during 1958 and 1959 contributed to the high average receipts per farm.

All Crops, acreage and value of crop production, page 6, reflect a substantial increase in the acreage of crops not irrigated in 1959. The total exceeds each of the three previous years and approaches the level of the pre-wheat acreage allotment period. An all-time high of 1.7 million irrigated acres and 8.0 million acres not irrigated is listed for 1953. The importance of irrigation was evident in the 1930's when the value of irrigated crops accounted for more than half of the total crop value. County values per acre for irrigated crops and crops not irrigated, pages 12 and 13, have wide variation. The crops grown must be suitable for certain types of soil and the length of the growing season.

Crops and Livestock During 1958 and 1959, pages 10 and 11, describes the influences affecting crop production and livestock marketings. Crop production on dryland depends on soil moisture reserves at the beginning of the growing season and precipitation during the spring and summer months. Nearly all of Montana's wheat is now grown on fallowed dryland where precipitation for two years is used to produce one crop in alternate years.

State Crop Tables, pages 14 to 24, carry total, irrigated and not irrigated data for 10 years 1950-59. Crops grown principally or entirely on land irrigated and not irrigated are so indicated by sub-titles and footnotes.

County Crop Tables, pages 25 to 53, present 1958 and 1959 acres planted and harvested, yield per acre, production and value for the total crop, acres harvested and yield per acre separately for the crop grown on land irrigated and not irrigated. Counties with insignificant, or no known production, are omitted from these tables.

Corn, County Tables, pages 54-65, cover the period 1948 through 1959. These tables contain acreage planted to corn for all purposes, acreage harvested for grain, acreage pastured or grazed and acreage, yield and production of corn harvested for silage. The silage category is separated into irrigated and not irrigated portions. During the twelve-year period concerned, the utilization of corn for silage has increased significantly while the acreage pastured and grazed has declined. Corn for silage has also expanded into new growing areas during the period.

Wheat and Barley Variety Tables, pages 66 to 74, carry the acreage planted and percentage of principal varieties for major producing counties and the State. Actual acreages are listed by counties for 1960 along with percentages for 1958 and 1960. The State table contains variety percentages for the years 1949, 1954, 1958 and 1959, also total, irrigated and not irrigated acres for 1960. Cheyenne is the leading variety of winter wheat with Karmont a distant second. Thatcher tops the list of spring wheat varieties and is followed by Rescue and Centana. Barley varieties are headed by Compana, with Betzes, the malting type, on the increase.

Wheat Production by Protein Groups, pages 75 to 77, is presented in tables for the 1958 and 1959 crops. Base prices and protein premiums reflect the value of premiums for spring wheat and winter wheat during the five crop years, 1955 to 1959. The 1959 spring wheat rated very high in protein content. County tables show where the high protein wheat is grown.

County Wheat Tables, pages 78 to 85, provide detailed information on acreage utilization, yield, production, and value for the years 1956 to 1959. These tables supplement the several wheat series for prior years appearing on pages 48-103 of Volume V, pages 89-97 of Volume VI, pages 32-37 of Volume VII and pages 26-31 of this issue.

State Livestock Tables, pages 86-91, present data for the years 1950 to 1959. They continue the series in previous volumes on inventory numbers, by age and sex groups, disposition and value of the principal kinds of livestock and livestock products.

County Livestock Tables, pages 92-94, list the January 1 inventory numbers of the principal livestock, including chickens, for the years 1958, 1959 and 1960. Numbers for 1960 are tentative and subject to revision, but any change will be relative for each county.

Cattle Movement Tables, pages 95-103, were prepared from information appearing on the brand inspection certificates of the Montana Livestock Commission. These data were hand tabulated for 1956 and 1957 and machine tabulated for 1958 and 1959. They provide detail on age and sex classes, by months, showing out-shipments by States of destination and movements in Montana. The tabulations are grouped according to inspections at local country points, Montana markets and designated markets in other States. Gross and net totals for counties have been prepared.

Wheat production by protein groups and cattle movement data where assembled with State funds matched with Federal funds received from the Agricultural Marketing Service, United States Department of Agriculture, under provisions of the Agricultural Marketing Act of 1946.

CROPS AND LIVESTOCK IN MONTANA DURING 1958

Crops: Total crop production (on a weight basis) in 1958 increased 9 per cent from 1957 and was 23 per cent above the average production for the ten years 1947-56. The acreage of all crops harvested, at 8,795,000, was about 3 per cent under the harvested acreage in 1957 and also 3 per cent under the 10-year average.

The 1958 crop season opened with adequate soil moisture to induce favorable growth of winter wheat and range grasses. Frequent showers provided sufficient soil moisture to germinate spring crops. Seeding operations were retarded somewhat by wet weather in April. Field work made good progress in May and was virtually completed by June 1. Unseasonally hot, dry weather during the last half of May depleted soil moisture supplies east of the Continental Divide and all dry-land crops showed signs of deterioration by June 1. Damage was particularly severe in some northeast counties. Small grains, hay and range grasses responded to frequent showers in June and during most of July. By June 30, stockmen were assured of good summer grazing and ample supplies of hay in all except the northeast area. Below average temperatures with adequate soil moisture during July were conducive to excellent crop development. The period of high temperatures and light rainfall which usually prevails between July 4 and July 21 did not appear until August. By that time dryland small grains had passed the critical stage of development and matured with good test weight and quality.

Above average temperatures and light precipitation in August provided ideal conditions for ripening grain. Warm, dry fall weather facilitated harvesting of grain and hay. Corn in the northeast area was severely damaged by lack of moisture and considerable acreage was abandoned or diverted to pasture. Digging of sugar beets was slowed somewhat by rain and low temperatures in October. Seeding of fall grains started in August and progressed slowly because of soil moisture shortages. Fall rains were inadequate to replenish moisture supplies in most counties east of the Continental Divide. The dryness impeded germination of winter wheat and stands were only fair in the major producing areas as winter set in.

Montana's wheat crop of 101,882,000 bushels was 24 per cent over the 81,986,000 bushels harvested in 1957 and 15 per cent over the 1947-56 average of 88,428,000 bushels. It was 11 per cent under the record crop of 114,232,000 bushels produced in 1953. Winter wheat production reached a record high of 64,542,000 bushels. Durum production at 840,000 bushels was the smallest since 1955. The other spring (bread) wheat crop totaled 36,500,000 bushels. This was 30 per cent over 1957 but only about two-thirds of the average for the preceding decade.

Oats production of 9,348,000 bushels was slightly below the previous year but about 3 per cent above average. The output of barley, at 52,239,000 bushels, was a record high. It was 15 per cent above the preceeding year and more than twice the 10-year average.

Hay cuttings amounted to 3.0 million tons. Although about the same as in 1957, the crop was 11 per cent below average because of smaller acreage harvested even though yield per acre was better than average.

The 320,000 bushel crop of flaxseed was up 16 per cent over 1957 but was only a little more than the long-time average. Mustard seed production increased from 12.7 million pounds in 1957 to 19.3 million pounds in 1958. The increase was due primarily to a better than average yield.

Less acreage and a lower yield reduced the alfalfa seed harvest 42 per cent from 1957. Crested wheat grass and sweet clover production declined sharply due to much smaller harvested acreages. The red clover seed crop was off because of a low yield.

Sugar beet tonnage was lower in 1958 due to smaller acreage and yield. The dry bean crop was larger than in 1957 from a better yield per acre. Potato production was up because of more harvested acres and a better yield than the previous year. The dry pea crop was too small to estimate. The corn harvest was down from 1957 because of reduction in both acreage and yield.

Cherry and apple crops in 1958 were each about 4 per cent above the previous year.

Livestock: Montana's cattle population increased 1 per cent during 1958, to 2,269,000 head on January 1, 1959. Prices increased during the year and reached a peak in October then fell off. However, they were considerably higher at the end of the year than at the beginning. Range conditions were good and for most months better than in 1957. Due to good grazing and increasing prices, marketing, on the basis of total pounds of beef sold were down 2 per cent from the year before. Sheep and lambs numbered 1,840,000 head at the close of 1958, an increase of 7 per cent for the year.

Hogs on farms January 1, 1959 totaled 147,000 head, an increase of 30 per cent during the year. Horse and mule numbers increased 1 per cent to 89,000 at the end of the year. The chicken population at 1,505,000 head on January 1, 1959 was an increase of 21,000 for the year 1958.

CROPS AND LIVESTOCK IN MONTANA DURING 1959[1]

Crops: Total crop production during 1959 was 7 per cent less than in 1958 but 11 per cent higher than average annual production for the ten years, 1948-57.

At the beginning of the 1959 growing season moisture reserves were adequate except for some southern and eastern areas. Winter kill of winter wheat was very heavy in northeastern counties as well as in some central and southern localities. Cold, dry weather hindered germination and growth of crops during April and throughout most of May. Rains during May and early June replenished moisture supplies. The latter part of June was hot an dry, as was July. However, subsoil moisture carried crops through the dry period with little deterioration except for eastern and southern counties. Winter wheat was sufficiently mature in all areas to escape heavy drought damage. The dry weather was ideal for harvest operations. Winter wheat seeding was delayed by dry soil but in September general rains relieved the situation. The crop made good growth before winter set in.

Wheat production in 1959 was down 19 per cent from the previous year and was the second lowest output (1957 was less) since 1949. Both lower yield and reduced acreage harvested contributed to the drop. Dry weather during the seeding period reduced the acreage planted and heavier than usual winter kill caused more loss of acreage. Winter wheat accounted for 56 per cent of production compared to 63 per cent in 1958. Spring wheat, of which 5 per cent was durum, made up 44 per cent of the wheat production. This compared to 37 per cent in 1958. Montana ranked as the 4th largest wheat producing State in 1959; was the largest producer of winter wheat and ranked second only to North Dakota in spring wheat output.

Production of oats in 1959 was off 17 per cent from a year earlier. Yield per acre was the lowest since 1954. Average yield per acre of the barley crop declined sharply from 1958, but a substantial increase in acreage for harvest elevated production slightly.

Hay production totaled 3.0 million tons, up slightly from 1958 and the largest output since 1955. Increased acreage in 1959 compared to the year before was only partially offset by lower tonnage per acre. Alfalfa hay accounted for 60 per cent of the total production. Wild hay 18 per cent, clover timothy 10 per cent and other hays 12 per cent.

Acreage seeded to flaxseed declined to the lowest level since 1952 causing a corresponding drop in production. Mustard seed output also was off with the lowest yield per acre since 1947. Production was 21 per cent below 1958 and the second smallest since 1954.

Alfalfa seed dipped to the lowest acreage and production figures since 1938, but output of red clover seed doubled from 1958 and was the largest crop since 1954. Sweetclover seed was taken from a sharply reduced acreage and dropped to the lowest point since 1932. Crested wheatgrass seed was harvested from twice the 1958 acreage giving the second highest production since 1950. Corn output increased slightly from 1958 even though acreage harvested was smaller.

Irrigated crops generally yielded well. Potato and dry bean production were each off slightly from 1958 due to decreased acreage harvested and slightly less yield per acre. Harvested acreage of sugar beets was reduced in 1959 due to freeze up before harvest was complete. Abandonment was the highest in recent years. Consequently, production was down from 1958 and the lowest since 1956.

Cherry production dropped 31 per cent from 1958 and was the second smallest crop since 1951. Apple production was down moderately from 1958.

Livestock: Cattle and calves on Montana farms and ranches increased 7 per cent during 1959 to 2,428,000 head on January 1, 1960. Prices held steady during the first three months of 1959; advanced in April and held through August declined in September and dropped steadily thereafter through December. Marketing of cattle and calves during 1959 totaled 913,000 head, a 14 per cent decline from 1958 marketings. Montana ranked as the 14th state in total cattle and calves on farms January 1, 1960, and was 7th in the number of beef cows.

The January 1, 1960, sheep and lamb inventory (including feeders), at 1,856,000 head showed an increase of 1 per cent compared to 1959. Lamb prices remained relatively unchanged during the first 8 months of 1959, but declined steadily the last 4 months of the year. Marketings in 1959 were 15 per cent heavier than during the previous year. Based on all sheep and lambs on farms January 1, 1960, Montana ranked as the 5th largest sheep state.

The hog population increased 12,000 head during 1959 making January 1, 1960 the largest inventory since 1952. The number of horses and mules increased slightly during 1959 but chickens on farms declined 5 per cent.

1 Preliminary
